

*The MGH project is expected to receive more than \$500mn and will produce green ammonia for export, write Tom Major and Stefan Krumpelmann*

## Australia picks Hydrogen Headstart winner

Australia's Labor government has selected a first winner under its Hydrogen Headstart scheme, with the planned Murchison Green Hydrogen (MGH) renewable ammonia scheme in the state of Western Australia (WA) due to receive A\$814mn (\$511mn) over 10 years.

The project, led by Danish fund manager Copenhagen Infrastructure Partners (CIP), is expected to produce 900,000 t/yr of renewable ammonia using 1.5GW of electrolyser capacity in the first stage, which will be supported with the Hydrogen Headstart funds. CIP says the plant could eventually produce 1.8mn t/yr of ammonia with 3GW of electrolysis capacity once fully developed.

In the first stage, the project will use dedicated renewable assets providing 1.2GW of solar photovoltaic capacity and 1.7GW of onshore wind capacity, alongside a 600MW/1.2GW battery energy storage system, according to the Australian Renewable Energy Agency (ArenA).

MGH was announced by Hydrogen Renewables Australia in 2019, before CIP [took control in 2022](#). The plant will be built in WA's Mid West region, 20km north of the coastal town of Kalbarri. Environmental applications will be lodged with the WA government for assessment this year, the MGH developers say, before a final investment decision can be taken. Construction is then expected to start by 2027 and take about five years, implying a 2032 start date. CIP is targeting exports, primarily to Asian markets.

The Hydrogen Headstart funding would be released in the 10 years after the start of production. The \$511mn in funding – based on prevailing exchange rates – would then amount to an effective subsidy of about \$57/t of ammonia, or roughly \$0.32/kg of hydrogen, over the support period.

The requested funding per MW of electrolysis capacity or kg of hydrogen produced was one of the criteria taken into account for the project assessments and CIP's submission for MGH might have been much lower than what the government had expected on average. When MGH launched the process in 2023, Canberra said the A\$2bn budget for the first round [could support about 1GW of electrolysis capacity](#), implying subsidies of close to A\$2/kg, or well over \$1/kg.

The \$0.32/kg would be lower than the [support secured by EU projects under the European Hydrogen Bank's pilot auction](#) last year. But MGH could also receive an additional A\$2/kg under [Australia's production tax credit scheme](#). Provided it starts operations by 2032, it could avail the tax credits for about eight years, given the 2040 cut-off for the support.

Canberra has suggested that at least some of the remaining A\$1.186bn from the first Hydrogen Headstart round could still be allocated. "Further information on other successful projects and round two will be made available in the coming months," energy minister Chris Bowen said.

A shortlist of six projects [was announced for the first round in late 2023](#), but several projects on that list [have since run into major obstacles](#) and some have been put on hold, limiting ArenA's options for allocating funding. Any unused funds might be used to top up the A\$2bn second round.

That said, Hydrogen Headstart as a whole faces an uncertain future. The programme has become a political issue in recent months, with the conservative opposition [promising to cut spending on renewable hydrogen](#) if it is elected in May.

## MARKET DEVELOPMENTS

*Dust contamination, and ground vibrations and turbulence caused by wind turbines could spoil the view, writes Pamela Machado*

Taltal and Mejillones, Chile

### Astronomers take aim at Chilean H2 plans

Chile's northern province of Antofagasta offers some of the world's highest solar irradiation, drawing several hydrogen project developers to the area. But the clear skies are also precious to star gazers, and scientists are concerned that the development of a hydrogen industry will hurt astronomical research.

US-headquartered utility AES' plans for a \$10bn renewable hydrogen and ammonia project in Antofagasta's southern Taltal region have come under fire after the firm [submitted environmental studies](#) to Chilean authorities in December.

Infrastructure for the Inna project would be spread over 3,000 hectares, between 10km and 20km from astronomical research sites, in an area that offers "the most pristine skies of the planet", according to the European Southern Observatory (ESO), an intergovernmental research organisation composed of 16 countries in Europe with observatories in northern Chile.

ESO studied the potential impact from Inna and found "alarming" results. The project would severely hamper observation activities because of light pollution, dust contamination, and ground vibrations and atmospheric turbulence caused by wind turbines, the body says. "As all mitigating actions have already been taken", the Inna project should move "at least 50 to 100km away", ESO says.

Chilean authorities have voiced similar concerns. Regional environmental secretariat Seremi says the project would be located in an area "with unique observation conditions at the national and international level" and has asked for more details on artificial light emissions and brightness.

Seremi further notes that some assets for the Inna project would be located outside the limits of the area designated by the state for large-scale renewable generation under Chile's long-term energy plan. These are areas determined by the government that allow for "economically efficient" renewable power generation while "maximising the sustainability of the territory".

Seremi suggested that AES should "re-evaluate the project location" and indicate the alternative locations considered, while also requesting more information about how the Inna project will impact local flora and fauna.

But moving the project would arguably require AES to start much of the planning from scratch after the years of work and ample resources already invested.

AES declined to comment on its Inna plans following an *Argus* request. But in a presentation to Chile's senate last week, the company stressed that it has been engaging with ESO since 2019. The Inna project would be "outside the exclusion zone reserved for the protection of astronomical observation", AES argued. The plans would "fully comply" with lighting standards that came into force in October and "in whose development ESO played a leading role", it said.

### Taltal signs

AES' plan anticipates that Inna would "contribute to the consolidation" of a hydrogen valley in the Taltal area, but the pushback might make other developers more inclined to look elsewhere.

Another large-scale renewable ammonia venture in Antofagasta is also undergoing environmental permitting, but developer MAE's [Volta project](#) is in Mejillones – about 300km north of Taltal – and would therefore not impact ESO's activities. Other developers – including Verano Energy, [FRV-X](#) and [Alkemyria](#) – have announced plans for Antofagasta, but have yet to disclose the exact locations.

Chilean authorities will have to strike a balance between stakeholders' interests. The Antofagasta government recently launched a tender for development of a hydrogen roadmap "in a sustainable manner" as a "strategic instrument" drawn up by the public and private sector along with academia and civil society.

## MARKET DEVELOPMENTS

**Thyssenkrupp has sounded the alarm about its planned DRI plant, saying H2 is too scarce and costly for the operation to be viable, writes Stefan Krumpelmann**

### Green H2 assumptions too ambitious: Thyssenkrupp

Initial assumptions about renewable hydrogen supply for German steelmaker Thyssenkrupp's planned direct reduced iron (DRI) plant in Duisburg were "too ambitious" and the firm might not be able to operate the facility in an "economically viable" manner for the foreseeable future, chief executive Miguel Lopez says.

With the DRI plant, Thyssenkrupp is "currently not just pushing the boundaries of what is technologically feasible", Lopez told the parliament of Germany's North-Rhine Westphalia (NRW) state on 19 March. "We are also pushing the boundaries of economic feasibility. Or as it stands today – beyond it."

When the decision to build the plant was taken, Thyssenkrupp and other stakeholders expected that there would be "sufficient hydrogen available at competitive prices" upon completion or following a transitional period of natural gas use at the latest, Lopez said. But the buildout of hydrogen infrastructure is not progressing as expected and renewable hydrogen is not competitive, regardless of whether it is produced domestically or imported, he said.

Thyssenkrupp **decided to build the plant in September 2022**, and in 2023 **secured €2bn in funding** from the federal and state governments. The bulk of this was to support renewable hydrogen purchases. Thyssenkrupp **reported strong participation in a tender for supply**, but says it has for now put the procurement process on hold, partly because bid prices were much higher than anticipated. It will have to discuss the situation with Germany's **next government** and the EU, as the procurement would have been made with public funds, Thyssenkrupp says.

The DRI plant was initially envisaged as starting in 2026, and to start switching away from natural gas to clean hydrogen in subsequent years into the 2030s.

Lopez told the NRW parliament that Thyssenkrupp still intends to build the plant. But while the facility could run on natural gas for longer, this does not serve the purpose of maximising emissions cuts and reducing dependence on fossil fuels, Lopez said. The new government will have to ensure speedy construction of hydrogen pipelines in Germany and Europe to facilitate transport, he said.

Northwest European DRI costs \$/t

### Guarantees to satisfy

Lopez's comments came shortly after German hydrogen industry body DWV and steel association WV Stahl called for government guarantees to provide security around hydrogen offtake deals and stimulate investment. Berlin should provide special loan guarantees to back up offtake agreements for hydrogen, the groups said on 17 March. They also urged the government to provide long-term financing and guarantee instruments not only for the country's core pipeline network, but also for storage, import terminals and ammonia cracking facilities.

Steelmaker Salzgitter **said earlier this month** that during a tender last year it had received offers for over 1mn t/yr of renewable hydrogen supply from more than 100 projects, with over a quarter of these located outside of the EU. But the firm's head of energy strategy, Alfred Hoffmann, also noted that seaborne imports would hinge on the availability of ammonia cracking facilities and other port infrastructure. And like Lopez, Hoffmann had also pointed to the high cost of renewable hydrogen compared with natural gas.

Lopez last week drew some optimism from the EU's **steel and metals action plan** that was published shortly before his speech. The plan "goes in the right direction" but must now be put into practice "rapidly and decisively", he said.

Hydrogen features heavily in the plan as a key decarbonisation route. The European Commission in the document reiterated its intention from the Clean Industrial Deal published last month to finalise a **definition of low-carbon hydrogen** this quarter and to launch another European hydrogen bank auction later this year.

## NEWS

## Japan's Iwatani exits Queensland on CQ-H2 pause

Japanese hydrogen supplier Iwatani has closed its office in Queensland, Australia, after the 2.9GW Central Queensland Hydrogen (CQ-H2) project was put on hold because the state government decided not to provide further funding.

Iwatani closed the office in early March after the CQ-H2 project was put on hold, the company tells *Argus*.

But it has not decided whether to follow its former partner, Japanese utility Kansai Electric Power, and fully withdraw from the project. Kansai Electric Power exited the venture last year. Iwatani says it is reviewing the next steps with its partner companies, including Australia's state-owned Stanwell, and it is unclear when the firm will make a decision. But it will be [challenging to continue the project](#) as its feasibility was based on the subsidy, as well as power, water and land offered by the state of Queensland, Iwatani says.

The Queensland state government said last month that it [would not provide equity and grant funding](#) of more than A\$1bn (\$632mn) to the project, casting doubt on its future. For Stanwell and its partners to progress, "it would have required significantly more than A\$1bn in state government funding, including infrastructure for water, port, transmission and hydrogen production", Queensland treasurer and energy minister David Janetzki said at the time. The decision followed a change in government last year, with the Liberal National party (LNP) taking over in October. CQ-H2 does "not align" with expectations to provide "affordable, reliable and sustainable power to Queenslanders", the LNP said.

CQ-H2 was one of the projects shortlisted for the first round of the Hydrogen Headstart subsidy scheme.

Iwatani says it will keep exploring opportunities for hydrogen production overseas, including in Australia. Iwatani and two partners, engineering company Kawasaki Heavy Industries (KHI) and refiner Eneos, last year decided to modify their procurement plan for a liquefied hydrogen shipping demonstration and switch the source to domestic production instead of output from an [Australian coal-to-hydrogen project](#).

## India reallocates subsidies for 1,000 t/yr of green H2

India has adjusted the renewable subsidies from its second renewable hydrogen support tender after one bidder failed to meet financial requirements, a government source tells *Argus*.

Initially, 10 out of 13 bidders [secured subsidies](#) for a cumulative 450,000 t/yr over the first three years of their planned projects.

But Indian firm Nishal Enterprises' bid under the biomass-based hydrogen category was cancelled as the company failed to submit a performance bank guarantee (PBG), the government source says. Bidders have to submit PBGs backed by a bank or financial institution to assure that their projects would be completed according to the terms of the contract.

With Nishal Enterprises out, engineering firm Matrix Gas and Renewables was the only successful bidder in the biomass category.

To maintain the total allocated capacity at 450,000 t/yr, state-owned Solar Energy Corporation of India (SECI) awarded subsidies for an additional 1,000 t/yr to conglomerate Reliance.

SECI also published the maximum subsidy amounts allocated to successful participants last week (*see table*).

## NEWS

## India picks Adani to enhance power grid for green H2

India has selected domestic conglomerate Adani's subsidiary, Adani Energy Solutions (AESL), to enhance electricity infrastructure for renewable hydrogen and ammonia production in the western state of Gujarat.

State-owned infrastructure financier Power Finance Corporation (PFC) picked AESL on the back of a tariff-based competitive bidding process [launched in October](#) for development of 3GW power transmission capacity from the Navinal substation to Mundra.

The transmission project is expected to cost about 28bn rupees (\$290mn) and will be "delivered" in 36 months, Adani said in an exchange filing.

PFC has transferred a special purpose vehicle – Mundra I Transmission – from its consulting arm to AESL for the project's development. Electricity demand from renewable hydrogen and ammonia projects in Mundra is expected to reach 22GW by 2029-30, according to the ministry of new and renewable energy.

Adani's own hydrogen plans could be one of the beneficiaries from the new power transmission capacity. The conglomerate sees Mundra port as a [key hydrogen hub](#), and is developing a renewable ammonia project with 1mn t/yr in the initial phase. The company has also secured 85,000 hectares in Rapar, Kutch, under [Gujarat's wasteland policy](#) for renewable hydrogen projects.

The award and potential progress on the power transmission plans will be good news to industry participants that are [worried about potential electricity transfer bottlenecks](#). Slow expansion of electricity transmission networks is a major challenge for India's renewable hydrogen ambitions, renewables firm Avaada's chairman, Vineet Mittal, told *Argus* this month.

*By Akansha Victor*

Mundra, India

## Egypt eyes \$5bn-6bn dedicated power grid for H2

Egypt's government is in talks with Indian power infrastructure company Sterlite Power about a proposal to build a separate electricity network in Egypt for renewable hydrogen projects, the ministry of investment and foreign trade says.

The government says Sterlite Power's proposed project would cost \$5bn-6bn, but the plans appear to be at an early stage because Cairo gave few details – notably the location in Egypt or when the developers might be able to build it. Sterlite Power was not immediately available for comment.

Sterlite sees a "promising market in Egypt" thanks to the government's support for renewable hydrogen projects, according to the ministry statement.

Egypt has [set out hydrogen incentives](#) for project developers and has [attracted the most proposals](#) in the Middle East, which could justify Sterlite's proposal.

A dedicated grid for electrolysis developers could trim overall system costs and might simplify compliance with rules for hydrogen production in export markets such as the EU. Countries including [Oman](#) have stressed that common user infrastructure makes a country more attractive by easing the burden on individual firms to build infrastructure.

Egypt's investment minister, Hassan El Khatib, also met with Indian developer ReNew Power to discuss the firm's [\\$8bn renewable ammonia proposal](#) in Egypt, the government says, without giving a firmer update. The project is at least six months behind schedule. It is more than two years since ReNew Power said it was [12-18 months from an investment decision](#). But ReNew Power's project is not alone in this, as delays have been a feature in Egypt, as indeed they have in the wider [Middle East region](#) and global market.

## NEWS

## TotalEnergies to wrap up green H2 supply deals by 2026

TotalEnergies aims to sign deals to buy an additional 300,000 t/yr of renewable hydrogen by the end of 2026, its refining and chemicals division hydrogen director, Sebastien Bruna, says.

The company has secured about 200,000 t/yr of renewable hydrogen since it launched a tender for 500,000 t/yr in [September 2023](#) to decarbonise its European refineries, and it aims to secure the rest before the end of 2026, Bruna says.

TotalEnergies' tender received more than 50 supply proposals totalling over 5mn t/yr of renewable hydrogen, its refining and petrochemicals director, Jean-Marc Durand, says. About 30pc came from EU-based bids and 70pc from elsewhere, he says.

Based on the bids, production in Europe and imports "come out at roughly the same price, that is three times the price of traditional European" fossil-based hydrogen, Durand says.

TotalEnergies recently entered a 30,000 t/yr offtake deal [with German utility RWE](#) for 15 years starting in 2030, and a 45,000 t/yr agreement with compatriot industrial gas firm [Air Liquide](#).

It agreed its largest deal last year with [US industrial gas company Air Products](#), under which TotalEnergies will take 70,000 t/yr of hydrogen from 2030. The supply will be delivered as ammonia and be cracked back into hydrogen in Europe.

TotalEnergies is also developing its own production projects, specifically at the La Mede and Grandpuits biorefineries in France.

## Chile invests \$26mn in electrolyser factories

Chile's economic development agency Corfo has awarded a combined \$25.6mn to three consortiums that stood out among 10 bids to build electrolyser manufacturing and assembly in the country. Two of the winning bids involve Chinese firms.

Chinese consortium Beijing SinoHy Energy, led by electrolyser maker Hygreen Energy, plans to assemble alkaline electrolyser units of 2.5MW and 5MW capacity in the central-southern Biobio region. The group aims to build the Hygreen BioBio H2V site in multiple phases over five years, with first operations expected to begin in 2026. Hygreen will combine its electrolyser knowledge with "market expertise" of local companies in Chile, it says. The site can supply the Chilean and "the broader Latin American" hydrogen sectors, the firm says.

Chilean firm Fastpack has tied up with the Brazilian arm of China's Guofu to build a manufacturing base in the capital of Santiago. The firms will assemble alkaline electrolyser units with a capacity of 100kW-1MW and proton exchange membrane electrolyzers of 50kW-1MW. The \$10mn project has \$6mn in funding from the Chilean government and \$4mn from the consortium partners, Guofu says. The plans include one electrolyser stack assembly line and three assembly lines for balance of plant kit. It will start in mid-2026, Guofu says.

Spanish-led consortium Joltech Solutions will build an "automatic manufacturing line for alkaline electrodes" in Biobio, working alongside the University of Concepcion and Enextex engineering. This will support assembly of electrolyzers of 100kW-1MW. Operations at the site are to start in 2026. Joltech and Guofu say they received \$10mn and \$6mn grants, respectively, which suggests Hygreen's grant is probably \$10mn, but Corfo did not provide a breakdown of its funding.

The three projects could bring over \$50mn investment and qualified personnel to Chile, aiding its hopes to become a [major renewable hydrogen producer](#).

*By Emily Russell*

## ANALYSIS

***EU certification troubles might stall prospective e-methane imports and divert some supply to Japan instead, writes Aidan Lea***

***E-methane producers could pivot to other markets. Japan is an attractive prospect because of mandates for blending e-methane with city gas from 2030***

## EU database plans leave global e-methane in limbo

Companies planning to make e-methane for export to the EU are struggling to progress plans as they do not know whether they will be able to log their products on the bloc's mandatory digital database.

E-methane involves combining hydrogen – typically from renewable power, with CO<sub>2</sub> – to make what is effectively synthetic natural gas. Proponents tout the possibility of using existing natural gas infrastructure – such as pipelines and LNG terminals – to transport and use the product.

But the EU's plans to demand extra layers of evidence from producers inadvertently rules out e-methane projects if they are connected to natural gas grids outside the bloc, according to companies and lobby groups. This could frustrate multiple project proposals that Argus is [tracking](#) in North America, Australia and elsewhere. Several developers have told Argus that their projects are affected.

The EU has set up the Union Database (UDB) to track fuels as they move through the supply chain – to prevent fraud and 'double counting' of emissions-saving benefits. This should help stop the kinds of abuse that have damaged the credibility of biofuels and carbon offsets in the past.

Brussels wants companies that claim certificates for using e-methane to prove that other firms have not already counted it for themselves, and that it is not counted towards national CO<sub>2</sub> reduction goals in the country where it is produced. This should be manageable for e-methane trading inside the EU because the Europe-wide database should be able to verify claims.

But the EU's demand poses a problem for e-methane projects that are connected to a gas grid outside the bloc – which might have their own tracking systems or none at all – because the EU cannot rule out double counting. Some e-methane projects eyeing deliveries to the EU would need to use gas pipelines to send their output to export terminals, for example.

### Coalition of the concerned

Lobbying on this has been a priority of the 21-company-strong E-NG Coalition, policy director Rafik Ammar says. The group is [co-ordinating with the biomethane industry](#), which is also concerned. It has urged the EU to clarify when it might harmonise UDB rules with non-EU countries, and wants an interim measure so e-methane projects do not stall, but has yet to receive a clear answer, Ammar says. The European Commission tells Argus it is "open to establishing co-operation frameworks" with countries outside the bloc, but has not given a time frame.

The EU's priority appears to be full UDB deployment among members, followed by alignment with neighbours that are physically connected by pipelines. The commission says it is in "technical talks" with Ukraine and the UK, but E-NG says those talks are at a very early stage. Arranging access to the UDB for external countries is implicitly a lower priority for the EU, much to the frustration of affected companies and governments. Concerned government officials from more than a dozen external countries – including the US, Canada, the UK and Japan – have started meeting to co-ordinate on best practices and positions, Ammar says.

E-methane producers could pivot to other markets. Japan is an attractive prospect because of mandates for blending e-methane with city gas from 2030. Some projects targeting e-methane exports to Japan are advancing, and developers have not flagged concerns over compliance with Japanese rules, Ammar says.

But missing out on EU customers would be a blow to producers and the impasse will curb, or at least delay, biomethane and e-methane production and probably make it trickier for companies operating in the EU to comply with the bloc's fuel switching policies, such as FuelEU Maritime, Ammar says.

ANALYSIS

**US green hydrogen’s troubled infancy could see stunted growth as a result of Trump’s disdain for climate-friendly policies, writes Jasmina Kelemen**

**45V survival key for US low-carbon H2 demand growth**

US demand for low-carbon hydrogen could rise more than tenfold between 2030 and 2050 as long as the 45V tax credit survives the current administration’s review of clean energy initiatives, based on projections from *Argus Consulting*.

Domestic demand for low-carbon hydrogen, made from renewable power or from natural gas with carbon capture and storage (CCS), reaches 850,000 t/yr by 2030 in the base-case scenario set out in *Argus Consulting’s Low-Carbon Hydrogen Strategy Report* for the Americas, published this month. Demand then rises sharply to 4.5mn t/yr by 2030 and 9.5mn t/yr by 2050. Much of the increase is driven by maritime applications, with the sector expected to account for more than half of the demand by 2030 on the assumption of substantial emissions reduction targets for international shipping.

For its base-case scenario, *Argus Consulting* uses goals laid out in the Department of Energy’s Blueprint for Transportation Decarbonisation and Industrial Decarbonisation Roadmap. It also assumes that 45V remains in place as a key tool for reducing low-carbon hydrogen production costs and stimulating uptake, especially in sectors such as fertiliser production.

Still, the base case represents a “moderate” scenario, given the lack of firm mandates for low-carbon hydrogen use in the US and “political headwinds”. President Donald Trump has paused federal disbursements for clean-energy projects and pledged to boost oil and gas drilling, sparking concerns that measures stemming from the previous administration’s Inflation Reduction Act is vulnerable to repeal. Trump’s embrace of fossil fuels has meant some incentives could be on the chopping block to pay for Republican-led tax cuts, and until the fate of 45V is settled, hydrogen projects are likely to remain in a holding pattern.

US low-carbon H2 capacity\* t/yr

**Stuttering start**

The US hydrogen sector is no stranger to regulatory uncertainty and has progressed in fits and starts since the Joe Biden administration announced the 45V tax credits in 2022. A [long wait for the final 45V rules](#), set out just weeks before Trump returned to office, had already made developers hesitant about advancing projects. Of the 14.6mn t/yr of low-carbon hydrogen capacity announced in the US with a specific start date, only about 12pc has reached the final investment decision (FID) or construction stage, based on *Argus Consulting* data.

Oil and gas firms [have thrown their support behind 45V](#) and have stressed that low-carbon hydrogen will have a key role to play in the future. “We base our actions around our beliefs – which doesn’t change anywhere around the world or with any particular political position – and that is [that] the future of energy is low carbon,” Chevron’s vice president of hydrogen, Austin Knight, told *Argus* in a recent interview. “When you take the view of continuing to drive down carbon intensity, these are the types of products that you need to bring to market.”

The most lucrative \$3/kg tax credit could already drive the cost of CCS-based hydrogen well below that of conventional supply with unabated emissions. But it remains to be seen whether producers can bring their lifecycle emissions down sufficiently to qualify. With the 45V incentives, renewable hydrogen costs could slip below those of conventional supply by the end of this decade, at least in some locations, based on *Argus Consulting’s* projections.

In any event, subsidies from abroad could also help to get projects off the ground. *Argus Consulting* estimates that nearly 5mn t/yr of low-carbon hydrogen capacity in the US, especially from CCS-based projects, is targeted at exports to northeast Asia, and developers will be looking to secure support through subsidy mechanisms in [Japan](#) and [South Korea](#).

45V hydrogen tax credit		\$/kg
Emissions kg of CO <sub>2</sub> e/kg of H <sub>2</sub> *	Base	Multiplier†
2.5-4	0.12	0.60
1.5 to <2.5	0.15	0.75
0.45 to <1.5	0.20	1.00
<0.45	0.60	3.00

\*based on lifecycle emissions; †applies if prevailing wage and apprenticeship requirements are met  
— US government

## IN BRIEF

**EU approves funding for next German CCfD round**

The EU has approved €5bn (\$5.4bn) in German state aid for companies under the bloc's emissions trading system (ETS) via carbon contracts for difference (CCfDs). Germany's scheme will decarbonise production processes through electrification, hydrogen, carbon capture or energy efficiency. Projects must cut greenhouse gas emissions by 60pc within three years and 90pc by the end of the 15-year CCfD timeframe compared with ETS benchmarks. Potential projects include fuel switching in the cement and lime sectors, chemical sector electrification and replacing traditional steel production with hydrogen-based direct reduction. Germany's first CCfD tender last year attracted 20 bids, exceeding its €4bn budget.

**Japan's Osaka Gas exits ReaCH4 e-methane project in US**

Japanese gas distributor Osaka Gas is to exit the ReaCH4 e-methane project in the US state of Louisiana, citing rising costs. The ReaCH4 project, which will continue to be developed by Tokyo Gas, Toho Gas, Mitsubishi and Semptra Infrastructure, aims to export 130,000 t/yr of synthetic methane to Japan by 2030 using the 15mn t/yr Cameron LNG facility. The developers aim to take a final investment decision in the 2025-26 fiscal year, Tokyo Gas tells Argus. Osaka Gas will focus on the e-methane project in the US Midwest it is developing with US firms Tallgrass Energy and Green Plains. That would export up to 200,000 t/yr by 2030 from the 15mn t/yr Freeport LNG terminal to Japan. Osaka Gas plans to blend e-methane into a future 622.6MW combined-cycle gas turbine unit by 2031, having won Japan's first auction for long-term zero emissions power capacity last year.

**Canada awards HTEC \$34mn for H2 liquefaction in British Columbia**

Canada has awarded C\$49mn (\$34.2mn) to Vancouver-based HTEC for a hydrogen liquefaction facility in British Columbia that could start by 2026. The C\$427mn project will capture by-product hydrogen vented from an Erco Worldwide sodium chlorate plant and liquefy it to supply HTEC's hydrogen refuelling stations in British Columbia and Alberta. The plant will make 15 t/d of what Canada's government called "low-carbon" hydrogen, enough for more than 100,000 truck refills annually, according to an HTEC project fact sheet. HTEC says this will offer the lowest carbon-intensity hydrogen in British Columbia and avoid up to 141,000t of CO<sub>2</sub>/yr. HTEC's H2 Gateway programme envisages up to 20 refuelling stations, three hydrogen production plants and a fleet of 100 fuel cell electric trucks.

**Hy2Gen lines up mining offtaker for Canadian green NH3**

German developer Hy2Gen has struck a preliminary deal to sell renewable ammonia from its project in Quebec, Canada, to an explosives producer. It would allow the buyer to end its reliance on imported ammonium nitrate, Hy2Gen chief executive Cyril Dufau-Sansot says. Hy2Gen will use 307MW of hydropower from Hydro-Quebec to make about 230,000 t/yr of ammonia. The project is at the front-end engineering design stage, with environmental studies under way. Hy2Gen targets a final investment decision by 2026 and the start of operations in 2029-30. Hydropower cuts production costs compared with using wind farms and energy storage, Dufau-Sansot says.

**EU approves €960mn Czech transition funding**

The EU has approved €960mn state aid in the Czech Republic to provide grants to firms making "strategic" equipment for a net zero economy – including batteries, solar panels, wind turbines, heat pumps, electrolyzers and carbon capture. Firms of any size can apply for the funds, which will be awarded by the end of this year.

Differentials between the costs of renewable and natural gas-based hydrogen are used in subsidy mechanisms to establish the cost of switching to supply with a lower emissions intensity. The spreads above are relevant for the following:

- 1 France's planned operational support scheme for renewable hydrogen plants
- 2 Future supply to Thyssenkrupp's direct reduced iron plant in Duisburg
- 3 Operational support granted to selected projects in Dutch subsidy scheme

Low-carbon ammonia benchmarks				25 Mar
	Unit	Cost		± 18 Mar
JKLAB CFR Ulsan, South Korea, incl. US 45Q tax credit	\$/t	607.99		-2.95
JKLAB CFR Ulsan, South Korea, excl. US 45Q tax credit	\$/t	743.99		-2.95
JKLAB CFR Niihama, Japan, differential	\$/t	+0.30		+0.09
EULAB CFR ARA, incl. 45Q US tax credit	\$/t	535.14		-3.32
EULAB CFR ARA, excl. 45Q US tax credit	\$/t	671.14		-3.32

The low-carbon ammonia benchmarks include the US Gulf coast Low-C ATR+CCS ammonia production cost (with and without the US' 45Q tax credit for carbon sequestration) and freight costs. Freight costs are for delivery to Ulsan, South Korea, for JKLAB and to Amsterdam-Rotterdam-Antwerp (ARA) for EULAB. For JKLAB, the Niihama differential reflects the cost difference for delivery to Niihama in Japan, rather than to Ulsan.
